

**METHOD FOR COMPUTING
STRUCTURAL STEEL MASS (WEIGHT)****COMPUTED MASS (WEIGHT)**

The engineer will compute the mass (weight) of structural steel on the basis of the following assumptions as to density - kilograms per cubic meter (pounds per cubic foot):

Steel	7850 kg/m ³	(490 lb./ft. ³)
Cast Iron	7210 kg/m ³	(450 lb./ft. ³)

The mass (weight) of rolled shapes and plates will be computed on the basis of their nominal mass (weight) and dimensions as shown in the contract documents, deducting for copes and cuts.

The mass (weight) of welds will be included in the computed mass (weight), assuming the mass (weight) of fillet welds to be used as follows:

MASS OF WELDS*

Size of Weld	Mass per Meter	Size of Weld	Mass per Meter
mm	kg	mm	kg
6	0.21	13	0.99
8	0.38	16	1.51
10	0.59	19	2.13

WEIGHT OF WELDS*

Size of Weld	Wt. per Foot	Size of Weld	Wt. per Foot
in.	lb.	in.	lb.
1/4	0.16	1/2	0.64
5/16	0.25	5/8	1.00
3/8	0.36	3/4	1.44

* The mass (weight) of welds shown is 1.5 times theoretical mass (weight).

The mass (weight) of heads, nuts, single washers, and threaded stick through of all high strength shop bolts shall be included in the computed mass (weight) on the basis of the following mass (weights):

Weight of ASTM A325 or A490 high strength bolts
Heavy hex structural bolts with heavy hex nuts in pounds per 100
